Change from the shared reference, coloured by internal emotion

Same cells, values and scale as the original atlas; each region uses its own emotion ramp, all peaking at yellow.

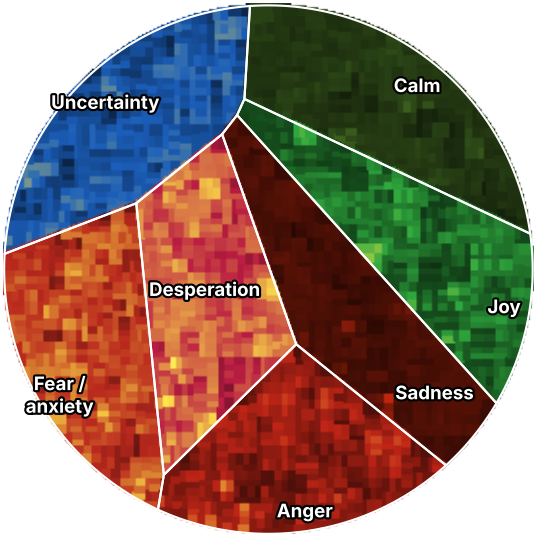

a UN0FA0 (reference)

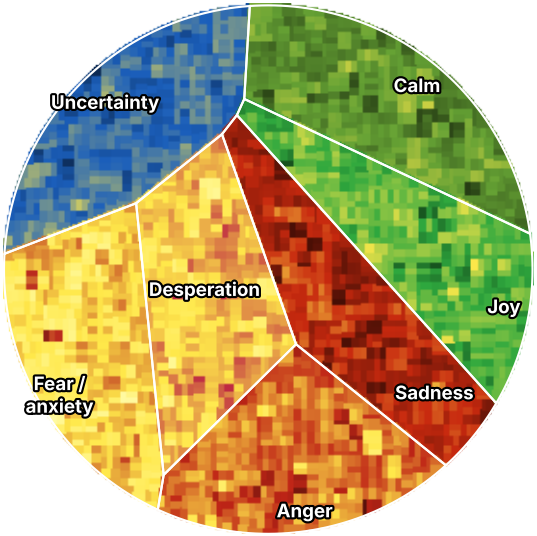

b UN0FA1

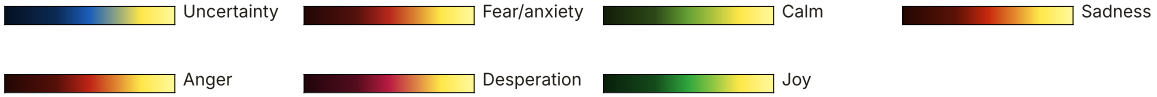

c UN1FA0

d UN1FA1

Change vs. UN0FA0: low → emotion colour → bright yellow (high)

Region geometry and cell values are identical to the original atlas; colour encodes the same within-item change, not emotion probability.
